

# 「連續自然數的乘方和定理」

## 如何被我發現

### 國中教師組數學第三名

屏東縣立中正國民中學

作 者：許 榮 家

一、研究動機：喬治・波利亞（George Polya）所著「數學研究法」（Mathematics and Plausible Reasoning）給我很多的啓示與靈感。書中引數學家高斯（Gauss）的話說：「數論中，常常有料想不到的好運氣，藉歸納法挖掘到最優美的新真理。」

依波利亞的猜測“ $1^2 + 2^2 + 3^2 + \dots + n^2 = \frac{n(n+1)(2n+1)}{6}$ ”及

“ $1^3 + 2^3 + 3^3 + \dots + n^3 = \frac{n^2(n+1)^2}{4}$ ”

這兩公式的發現過程大概是這樣的

$$n = 1, 2, 3, 4, 5, 6, 7, \dots, n$$

$$1 + 2 + 3 + \dots + n = 1, 3, 6, 10, 15, 21, 28, \dots, \frac{n(n+1)}{2}$$

$$1^2 + 2^2 + 3^2 + \dots + n^2 = 1, 5, 14, 30, 55, 91, 140, \dots, \sum_{i=1}^n i^2$$

$$\frac{1^2 + 2^2 + 3^2 + \dots + n^2}{1 + 2 + 3 + \dots + n}$$

$$= \frac{3}{3}, \frac{5}{3}, \frac{7}{3}, \frac{11}{3}, \frac{9}{3}, \frac{13}{3}, \frac{15}{3}, \dots, \frac{2n+1}{3}$$

$$\text{故 } 1^2 + 2^2 + 3^2 + \dots + n^2 = \frac{2n+1}{3}(1+2+3+\dots+n)$$

$$= \frac{2n+1}{3} \cdot \frac{n(n+1)}{2} = \frac{n(n+1)(2n+1)}{6}$$

$$\begin{aligned}
 1^3 &= 1 = 1^2 = (1)^2 \\
 1^3 + 2^3 &= 9 = 3^2 = (1+2)^2 \\
 1^3 + 2^3 + 3^3 &= 36 = 6^2 = (1+2+3)^2 \\
 1^3 + 2^3 + 3^3 + 4^3 &= 100 = 10^2 = (1+2+3+4)^2 \\
 1^3 + 2^3 + 3^3 + 4^3 + 5^3 &= 225 = 15^2 = (1+2+3+4+5)^2 \\
 &\dots
 \end{aligned}$$

$$\text{故 } 1^3 + 2^3 + 3^3 + \dots + n^3 = (1+2+3+\dots+n)^2$$

$$= \left[ \frac{n(n+1)}{2} \right]^2 = \frac{n^2(n+1)^2}{4}$$

因而引起了我研究“ $1^k + 2^k + 3^k + \dots + n^k = ?$  當  $k=1, 2, 3, \dots$ ”的興趣與動機。

## 二、研究過程：

$$\begin{aligned}
 (1) \quad n &= 1, 2, 3, 4, 5, 6, 7, \dots \\
 1^2 + 2^2 + 3^2 + \dots + n^2 &= 1, 5, 14, 30, 55, 91, 140, \dots \\
 1^4 + 2^4 + 3^4 + \dots + n^4 &= 1, 17, 98, 354, 979, 2275, 4676, \dots \\
 \frac{1^4 + 2^4 + 3^4 + \dots + n^4}{1^2 + 2^2 + 3^2 + \dots + n^2} \\
 &= \frac{5}{5}, \frac{17}{5}, \frac{35}{5}, \frac{59}{5}, \frac{89}{5}, \frac{125}{5}, \frac{167}{5}, \dots
 \end{aligned}$$

觀察上列分子的數列  $5, 17, 35, 59, 89, 125, 167, \dots$

其相鄰二項的差  $12, 18, 24, 30, 36, 42 \dots$

再求上列相鄰二項的差  $6, 6, 6, 6, 6 \dots$

由此可發現分子的數列中，相鄰二項的差都是 6 的倍數，且

$$5 = 1 \cdot 6 - 1$$

$$17 = (1+2) \cdot 6 - 1$$

$$35 = (1+2+3) \cdot 6 - 1$$

$$59 = (1+2+3+4) \cdot 6 - 1$$

$$89 = (1+2+3+4+5) \cdot 6 - 1$$

$$125 = (1+2+3+4+5+6) \cdot 6 - 1$$

$$167 = (1+2+3+4+5+6+7) \cdot 6 - 1$$

.....

因此 當  $n = 1, 2,$

$$\text{則 } \frac{1^4+2^4+3^4+\cdots+n^4}{1^2+2^2+3^2+\cdots+n^2} = \frac{1 \cdot 6 - 1}{5}, \frac{(1+2) \cdot 6 - 1}{5},$$

$3, \dots, n$

$$\frac{(1+2+3) \cdot 6 - 1}{5}, \dots, \frac{(1+2+3+\cdots+n) \cdot 6 - 1}{5}$$

$$\text{故 } 1^4+2^4+3^4+\cdots+n^4 = \frac{(1+2+3+\cdots+n) \cdot 6 - 1}{5}$$

$$= (1^2+2^2+3^2+\cdots+n^2)$$

$$\begin{aligned} &= \frac{n(n+1)}{2} \cdot \frac{6-1}{5} \cdot \frac{n(n+1)(2n+1)}{6} \\ &= \frac{n(n+1)(2n+1)(3n^2+3n-1)}{30} \end{aligned}$$

$$(2) \quad n = 1, 2, 3, 4, 5, 6, \dots$$

$$1^3+2^3+3^3+\cdots+n^3 = 1, 9, 36, 100, 225, 441, \dots$$

$$1^5+2^5+3^5+\cdots+n^5 = 1, 33, 276, 1300, 4425, 12201, \dots$$

$$\frac{1^5+2^5+3^5+\cdots+n^5}{1^3+2^3+3^3+\cdots+n^3} = \frac{3}{3}, \frac{11}{3}, \frac{23}{3}, \frac{39}{3}, \frac{59}{3}, \frac{83}{3}, \dots$$

觀察上列分子的數列  $3, 11, 23, 39, 59, 83, 111, \dots$

相鄰二項的差  $8, 12, 16, 20, 24, 28, \dots$

上列相鄰二項的差  $4, 4, 4, 4, 4, \dots$

由此不難發現分子的數列中，相鄰二項的差都是4的倍數

因此 當  $n = 1, 2$

$$\text{則 } \frac{1^5+2^5+3^5+\cdots+n^5}{1^3+2^3+3^3+\cdots+n^3} = \frac{1 \cdot 4 - 1}{3}, \frac{(1+2) \cdot 4 - 1}{3},$$

$3, \dots, n$

$$\frac{(1+2+3) \cdot 4 - 1}{3}, \dots, \frac{(1+2+3+\cdots+n) \cdot 4 - 1}{3}$$

$$\text{故 } 1^5 + 2^5 + 3^5 + \cdots + n^5 = \frac{(1+2+3+\cdots+n) \cdot 4 - 1}{3} \cdot$$

$$(1^3 + 2^3 + 3^3 + \cdots + n^3)$$

$$= \frac{\frac{n(n+1)}{2} \cdot 4 - 1}{3} \cdot \frac{n^2(n+1)^2}{4} = \frac{n^2(n+1)^2}{12}$$

$$\frac{2n^2 + (2n-1)}{12}$$

(3) 現在把上列各式的右邊都展開成展開式

$$\sum_{i=1}^n i = 1 + 2 + \cdots + n = \frac{1}{2}n^2 + \frac{1}{2}n$$

$$\sum_{i=1}^n i^2 = 1^2 + 2^2 + \cdots + n^2 = \frac{1}{3}n^3 + \frac{1}{2}n^2 + \frac{2}{12}n$$

$$\sum_{i=1}^n i^3 = 1^3 + 2^3 + \cdots + n^3 = \frac{1}{4}n^4 + \frac{1}{2}n^3 + \frac{3}{12}n^2 + 0 \cdot n$$

$$\sum_{i=1}^n i^4 = 1^4 + 2^4 + \cdots + n^4 = \frac{1}{5}n^5 + \frac{1}{2}n^4 + \frac{4}{12}n^3$$

$$+ 0 \cdot n^2 - \frac{4}{120}n$$

$$\sum_{i=1}^n i^5 = 1^5 + 2^5 + \cdots + n^5 = \frac{1}{6}n^6 + \frac{1}{2}n^5 + \frac{5}{12}n^4$$

$$+ 0 \cdot n^3 - \frac{10}{120}n^2 + 0 \cdot n$$

(I) 以歸納法的態度觀察上列各式右邊的特性及差異，可以這樣猜測

$$\sum_{i=1}^n i^5 = \frac{1}{7}n^7 + \frac{1}{2}n^6 + \frac{6}{12}n^5 + 0 \cdot n^4 - \frac{x}{120}n^3$$

$$+ 0 \cdot n^2 + \frac{6}{y}n$$

$$\text{令 } n = 1, \text{ 得 } 1 = -\frac{1}{7} + \frac{1}{2} + -\frac{6}{12} - \frac{x}{120} + \frac{6}{y}$$

$$\text{令 } n = 2, \text{ 得 } 65 = -\frac{1}{7} \cdot 2^7 + \frac{1}{2} \cdot 2^6 + -\frac{6}{12} \cdot 2^5 - \frac{x}{120} \cdot 2^3 \\ + \frac{6}{y} \cdot 2$$

$$\text{聯立解之, 得 } x = 20, \quad y = 252.$$

當  $n = 3, 4, 5, \dots, 9$  演算之均適合

$$\text{故 } \sum_{i=1}^n i^6 = -\frac{1}{7}n^7 + \frac{1}{2}n^6 + -\frac{6}{12}n^5 + 0 \cdot n^4 - \frac{20}{120}n^3 \\ + 0 \cdot n^2 + \frac{6}{252}n$$

$$\text{通分後分解之, 得 } \sum_{i=1}^n i^6 = \frac{n(n+1)(2n+1)(3n^4+6n^3-3n+1)}{24}$$

$$(\text{II}) \text{ 同法可求得 } \sum_{i=1}^n i^7 = -\frac{1}{8}n^8 + \frac{1}{2}n^7 + \frac{7}{12}n^6 + 0 \cdot n^5 \\ - \frac{35}{102}n^4 + 0 \cdot n^3 + \frac{21}{252}n^2 + 0 \cdot n$$

$$\sum_{i=1}^n i^7 = 1^7 + 2^7 + 3^7 + \dots + n^7 = \frac{n^2(n+1)^2(3n^4+6n^3-n^2-4n+2)}{24}$$

$$\text{即假設 } \sum_{i=1}^n i^7 = -\frac{1}{8}n^8 + \frac{1}{2}n^7 + \frac{7}{12}n^6 + 0 \cdot n^5 - \frac{x}{120}n^4 \\ + 0 \cdot n^3 + \frac{y}{252}n^2 + 0 \cdot n$$

$$\text{解之得 } x = 35, \quad y = 21$$

(III) 觀察有理係數中分母是120的分子所成的數列

$$4, 10, 20, 35, 56, 84$$

相鄰二項的差 6 10 15 21 28

相鄰二項的差 4 5 6 7 ← — 猜測

與(I)同法，先設  $\sum_{i=1}^n i^8 = \frac{1}{9}n^9 + \frac{1}{2}n^8 + \frac{8}{12}n^7 + 0 \cdot n^6$

$$-\frac{56}{120}n^5 + 0 \cdot n^4 + \frac{x}{252}n^3 + 0 \cdot n^2 - \frac{8}{y}n$$

再分別令  $n = 1, 2$  聯立解之，可得  $x = 56, y = 240$

當  $n = 3, 4, \dots, 9$  驗之均同

故  $\sum_{i=1}^n i^8 = \frac{1}{9}n^9 + \frac{1}{2}n^8 + \frac{8}{12}n^7 + 0 \cdot n^6$

$$-\frac{56}{120}n^5 + 0 \cdot n^4 + \frac{56}{252}n^3 + 0 \cdot n^2 - \frac{8}{240}n$$

$$= \frac{n(n+1)(2n+1)(5n^6 + 15n^5 + 5n^4 - 15n^3 - n^2 + 9n - 3)}{90}$$

同(II)之法，可求得  $\sum_{i=1}^n i^9 = \frac{1}{10}n^{10} + \frac{1}{2}n^9$

$$+\frac{9}{12}n^8 + 0 \cdot n^7 - \frac{84}{120}n^6 + 0 \cdot n^5 + \frac{126}{252}n^4 + 0 \cdot n^3$$

$$-\frac{36}{240}n^2 + 0 \cdot n$$

$$= \frac{n^2(n+1)^2(2n^6 + 6n^5 + n^4 - 8n^3 + n^2 + 6n - 3)}{20}$$

(IV)用數學歸納法證明(證明請看“IV結果證明”一欄)上列各式的

同時，又發現了  $\sum_{i=1}^n i^k$  的展開式中，有理係數的分子實與  $(a+b)^k$  的展開式的係數相關，試觀察巴斯卡爾數三角形(Pascal's triangle)並與上列各式右邊的展開式的係數的分子相比較後，我們很自然的會這樣的猜測：

$$\sum_{i=1}^n i^{10} = \frac{1}{11} n^{11} + \frac{1}{2} n^{10} + \frac{10}{12} n^9 + 0 \cdot n^8 - \frac{120}{120} n^7 + 0 \cdot n^6$$

$$+ \frac{252}{252} n^5 + 0 \cdot n^4 - \frac{120}{240} n^3 + 0 \cdot n^2 + \frac{10}{t_{10}} n$$

$$\text{令 } n = 1, \text{ 得 } 1 = \frac{1}{11} + \frac{1}{2} + \frac{10}{12} - \frac{120}{120} + \frac{252}{252} - \frac{120}{240}$$

$$+ \frac{10}{t_{10}}$$

$$\text{解之得 } t_{10} = 132$$

$$\begin{aligned} \text{設 } \sum_{i=1}^n i^{11} &= \frac{1}{12} n^{12} + \frac{1}{2} n^{11} + \frac{11}{12} n^{10} + 0 \cdot n^9 \\ &- \frac{165}{120} n^8 + 0 \cdot n^7 + \frac{462}{252} n^6 + 0 \cdot n^5 - \frac{330}{240} n^4 + 0 \cdot n^3 \\ &+ \frac{55}{132} n^2 + \frac{11}{t_{11}} n \end{aligned}$$

$$\begin{aligned} \sum_{i=1}^n i^{12} &= \frac{1}{13} n^{13} + \frac{1}{2} n^{12} + \frac{12}{12} n^{11} + 0 \cdot n^{10} \\ &- \frac{220}{120} n^9 + 0 \cdot n^8 + \frac{792}{252} n^7 + 0 \cdot n^6 - \frac{792}{240} n^5 + 0 \cdot n^4 \\ &+ \frac{220}{132} n^3 + 0 \cdot n^2 + \frac{12}{t_{12}} n \end{aligned}$$

$$\text{令 } n = 1, \text{ 分別解之各得 } \frac{11}{t_{11}} = 0 \text{ 及 } t_{12} = -\frac{32760}{691}$$

巴斯卡爾數三角形 ( Pascal's triangle )

$$\binom{N}{k-1} + \binom{N}{k} = \binom{N+1}{k}$$

### 三、研究結果：

$$(I) \sum_{i=1}^n i = \frac{n(n+1)}{2} = \frac{1}{2}(n^2+n)$$

$$\sum_{i=1}^n i^2 = \frac{n(n+1)(2n+1)}{6} = \frac{1}{6}(2n^3 + 3n^2 + n)$$

$$\sum_{i=1}^n i^3 = \frac{n^2(n+1)^2}{4} = \frac{1}{4}(n^4 + 2n^3 + n^2)$$

$$\sum_{i=1}^n i^4 = \frac{n(n+1)(2n+1)(3n^2+3n-1)}{30}$$

$$= -\frac{1}{30}(6n^5 + 15n^4 + 10n^3 - n)$$

$$\sum_{i=1}^n i^5 = \frac{n^2(n+1)^2(2n^2+2n-1)}{12}$$

$$= \frac{1}{12} (2n^6 + 9n^5 + 5n^4 - n^2)$$

$$\sum_{i=1}^n i^6 = \frac{n(n+1)(2n+1)(3n^4+9n^3-3n+1)}{42}$$

$$= \frac{1}{42} (9n^7 + 21n^6 + 21n^5 - 7n^3 + n)$$

$$\sum_{i=1}^n i^7 = \frac{n^2(n+1)^2(3n^4+6n^3-n^2-4n+2)}{24}$$

$$= \frac{1}{24} (3n^8 + 12n^7 + 14n^6 - 7n^4 + 2n^2)$$

$$\sum_{i=1}^n i^8 = \frac{n(n+1)(2n+1)(5n^6+15n^5+5n^4-15n^3-n^2+9n-3)}{90}$$

$$= \frac{1}{90} (10n^9 + 45n^8 + 60n^7 - 42n^5 + 20n^3 - 3n)$$

$$\sum_{i=1}^n i^9 = \frac{n^2(n+1)^2(2n^6+6n^5+n^4-8n^3+n^2+6n-3)}{20}$$

$$= \frac{1}{20} (2n^{10} + 10n^9 + 15n^8 - 14n^6 + 10n^4 - 3n^2)$$

$$\sum_{i=1}^n i^{10} = \frac{n(n+1)(2n+1)(3n^8+12n^7+8n^6-18n^5-10^4}{66}$$

$$+ \frac{24n^3+2n^2-15n+5}{66})$$

$$= \frac{1}{66} (6n^{11} + 33n^{10} + 55n^9 - 66n^7 + 66n^5 - 33n^3 + 5n)$$

.....

$$\begin{aligned}
(II) \sum_{i=1}^n i &= \frac{1}{2}n^2 + \frac{1}{2}n \\
\sum_{i=1}^n i^2 &= \frac{1}{3}n^3 + \frac{1}{2}n^2 + \frac{2}{12}n \\
\sum_{i=1}^n i^3 &= \frac{1}{4}n^4 + \frac{1}{2}n^3 + \frac{2}{12}n^2 + 0 \cdot n \\
\sum_{i=1}^n i^4 &= \frac{1}{5}n^5 + \frac{1}{2}n^4 + \frac{4}{12}n^3 + 0 \cdot n^2 - \frac{4}{120}n \\
\sum_{i=1}^n i^5 &= \frac{1}{6}n^6 + \frac{1}{2}n^5 + \frac{5}{12}n^4 + 0 \cdot n^3 - \frac{10}{120}n^2 + 0 \cdot n \\
\sum_{i=1}^n i^6 &= \frac{1}{7}n^7 + \frac{1}{2}n^6 + \frac{6}{12}n^5 + 0 \cdot n^4 - \frac{20}{120}n^3 + 0 \cdot n^2 \\
&\quad + \frac{6}{252}n \\
\sum_{i=1}^n i^7 &= \frac{1}{8}n^8 + \frac{1}{2}n^7 + \frac{7}{12}n^6 + 0 \cdot n^5 - \frac{35}{120}n^4 + 0 \cdot n^3 \\
&\quad + \frac{21}{252}n^2 + 0 \cdot n \\
\sum_{i=1}^n i^8 &= \frac{1}{9}n^9 + \frac{1}{2}n^8 + \frac{8}{12}n^7 + 0 \cdot n^6 - \frac{56}{120}n^5 + 0 \cdot n^4 \\
&\quad + \frac{56}{252}n^3 + 0 \cdot n^2 - \frac{8}{240}n \\
\sum_{i=1}^n i^9 &= \frac{1}{10}n^{10} + \frac{1}{2}n^9 + \frac{9}{12}n^8 + 0 \cdot n^7 - \frac{84}{120}n^6 + 0 \cdot n^5 \\
&\quad + \frac{126}{252}n^4 + 0 \cdot n^3 - \frac{36}{240}n^2 + 0 \cdot n
\end{aligned}$$

$$\sum_{i=1}^n i^{10} = -\frac{1}{11}n^{11} + \frac{1}{2}n^{10} + \frac{10}{12}n^9 + 0 \cdot n^8 - \frac{120}{120}n^7 + 0 \cdot n^6$$

$$+ \frac{252}{252}n^5 + 0 \cdot n^4 - \frac{120}{240}n^3 + 0 \cdot n + \frac{10}{132}n$$

.....

$$\text{其中 } 1 = \frac{1}{2} + \frac{1}{2}$$

$$1 = \frac{1}{3} + \frac{1}{2} + \frac{2}{12}$$

$$1 = \frac{1}{4} + \frac{1}{2} + \frac{3}{12} + 0$$

$$1 = \frac{1}{5} + \frac{1}{2} + \frac{4}{12} + 0 - \frac{4}{120}$$

$$1 = \frac{1}{6} + \frac{1}{2} + \frac{5}{12} + 0 - \frac{10}{120} + 0$$

.....

(III) 用歸納法將(II)的結果一般化，可得其通式如下：

$$\sum_{i=1}^n i^k = \frac{1}{k+1}n^{k+1} + \frac{1}{2}n^k + \frac{\binom{k}{1}}{12}n^{k-1} - \frac{\binom{k}{3}}{120}n^{k-3} +$$

$$\frac{\binom{k}{5}}{252}n^{k-5} - \frac{\binom{k}{7}}{240}n^{k-7} + \frac{\binom{k}{9}}{132}n^{k-9} - \dots + \frac{\binom{k}{k-1}}{t_k}n$$

$$k \in N = \{1, 2, 3, 4, \dots\}$$

$$\text{而其中 } 1 = \frac{1}{k-1} + \frac{1}{2} + \frac{\binom{k}{1}}{12} - \frac{\binom{k}{3}}{120} + \frac{\binom{k}{5}}{252} - \frac{\binom{k}{7}}{240}$$

$$+ \frac{\binom{k}{9}}{132} - \dots + \frac{\binom{k}{k-1}}{t_k}$$

\* 符號說明： $\binom{k}{t}$  表示  $(a+b)^k$  的展開式中  $a^{k-t} b^t$  項的係數，亦即相異反物中取出  $t$  個的組合數，與  $C_t^k$ ， $_k C_t$ ， $C(k, t)$  通

$$(IV) \text{ 上面的通式又可寫成 } \sum_{i=1}^n i^k = \frac{1}{k+1} n^{k-1} + \sum_{j=1}^k \frac{\binom{k}{j-1}}{t_j} n^{k-j+1}$$

$$\text{令 } n = 1 \text{ 可得 } 1 = \frac{1}{k+1} + \sum_{j=1}^k \frac{\binom{k}{j-1}}{t_j}$$

再令  $k = 1, 2, 3, 4, \dots$ ，可得：

$$1 = \frac{1}{2} + \frac{1}{t_1}$$

$$1 = \frac{1}{3} + \frac{1}{t_1} + \frac{2}{t_2}$$

$$1 = \frac{1}{4} + \frac{1}{t_1} + \frac{3}{t_2} + \frac{3}{t_3}$$

$$1 = \frac{1}{5} + \frac{1}{t_1} + \frac{4}{t_2} + \frac{6}{t_3} + \frac{4}{t_4}$$

.....

由此可分別求得  $\frac{1}{t_1} = \frac{1}{2}$ ， $\frac{1}{t_2} = \frac{1}{12}$ ， $\frac{1}{t_3} = 0$ ，

$$\frac{1}{t_4} = -\frac{1}{120}, \dots$$

當  $j = 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, \dots$

求得  $\frac{1}{t_j} = \frac{1}{2}, -\frac{1}{12}, 0, -\frac{1}{120}, 0, \frac{1}{252}, 0, -\frac{1}{240}, 0,$

$$\frac{1}{132}, 0, -\frac{691}{32760}, \dots$$

討論分析之，可有下列之性質：（其中  $S \in N$ ）

$$j = 1 \quad \frac{1}{t_j} = \frac{1}{2}$$

$$j = 2S + 1 \quad \frac{1}{t_j} = 0$$

$$j = 4S \quad \frac{1}{t_j} < 0$$

$$j = 4S + 2 \quad \frac{1}{t_j} > 0$$

四、結果證明：上面各結果均可用數學歸納法證明之，現舉三例證明如下：

$$(I) \sum_{i=1}^n i^6 = \frac{1}{7}n^7 + \frac{1}{2}n^6 + \frac{6}{12}n^5 + 0 \cdot n^4 - \frac{20}{120}n^3 \\ + 0 \cdot n^2 + \frac{6}{256}n$$

證明：當  $n=1$  時，  $1 = \frac{1}{7} + \frac{1}{2} + \frac{6}{12} - \frac{20}{120} + \frac{6}{252}$ ，本式

成立

$$\text{令 } n=r \text{ 時，本式成立 即 } \sum_{i=1}^r i^6 = \frac{1}{7}r^7 + \frac{1}{2}r^6 \\ + \frac{6}{12}r^5 - \frac{20}{120}r^3 + \frac{6}{252}r$$

$$\text{則 } \frac{1}{7}(r+1)^7 + \frac{1}{2}(r+1)^6 + \frac{6}{12}(r+1)^5 - \frac{20}{120}(r+1)^3 \\ + \frac{6}{252}(r+1)$$

$$\begin{aligned}
&= \frac{1}{7}r^7 + \frac{1}{2}r^6 + \frac{6}{12}r^5 - \frac{20}{120}r^3 + \frac{6}{252}r + \frac{1}{7} \cdot 7r^6 \\
&\quad + (-\frac{1}{7} \cdot 21 + \frac{1}{2} \cdot 6) r^5 + (-\frac{1}{7} \cdot 35 + \frac{1}{2} \cdot 15 \\
&\quad + \frac{6}{12} \cdot 5) r^4 + (\frac{1}{7} \cdot 35 + \frac{1}{2} \cdot 20 + \frac{6}{12} \cdot 10) r^3 \\
&\quad + (-\frac{1}{7} \cdot 21 + \frac{1}{2} \cdot 15 + \frac{6}{12} \cdot 10 - \frac{20}{120} \cdot 3) r^2 \\
&\quad + (-\frac{1}{7} \cdot 7 + \frac{1}{2} \cdot 6 + \frac{6}{12} \cdot 5 - \frac{20}{120} \cdot 3) r \\
&\quad + (-\frac{1}{7} + \frac{1}{2} + \frac{6}{12} - \frac{20}{120} + \frac{6}{252}) \\
&= \sum_{i=1}^r i^6 + (r+1)^6 = \sum_{i=1}^{r+1} i^6
\end{aligned}$$

即  $n = r + 1$  時，本式亦成立

故本式對所有  $n = 1, 2, 3, \dots$  均成立

$$\begin{aligned}
\sum_{i=1}^n i^7 &= \frac{1}{8}n^8 + \frac{1}{2}n^7 + \frac{7}{12}n^6 + 0 \cdot n^5 - \frac{35}{120}n^4 + 0 \cdot n^3 \\
&\quad + \frac{21}{252}n^2 + 0 \cdot n
\end{aligned}$$

證明：當  $n=1$  時， $1 = \frac{1}{8} + \frac{1}{2} + \frac{7}{12} - \frac{35}{120} + \frac{21}{252}$ ，本式

成立

令  $n = r$  時，本式成立，即  $\sum_{i=1}^r i^7 = \frac{1}{8}r^8 + \frac{1}{2}r^7 + \frac{7}{12}r^6$

$$- \frac{35}{120}r^4 + \frac{21}{252}r^2$$

$$\text{則 } \frac{1}{8}(r+1)^8 + \frac{1}{2}(r+1)^7 + \frac{7}{12}(r+1)^6$$

$$- \frac{35}{120}(r+1)^4 + \frac{21}{252}(r+1)^2$$

$$= \frac{1}{8}r^8 + \frac{1}{2}r^7 + \frac{7}{12}r^6 - \frac{35}{120}r^4 + \frac{21}{252}r^2 + \frac{1}{8} \cdot 8r^7$$

$$+ (-\frac{1}{8} \cdot 28 + \frac{1}{2} \cdot 7) r^6$$

$$+ (-\frac{1}{8} \cdot 56 + \frac{1}{2} \cdot 21 + \frac{7}{12} \cdot 6) r^5$$

$$+ (-\frac{1}{8} \cdot 70 + \frac{1}{2} \cdot 35 + \frac{7}{12} \cdot 1) r^4$$

$$+ (-\frac{1}{8} \cdot 56 + \frac{1}{2} \cdot 35 + \frac{7}{12} \cdot 20 - \frac{35}{120} \cdot 4) r^3$$

$$+ (-\frac{1}{8} \cdot 28 + \frac{1}{2} \cdot 21 + \frac{7}{12} \cdot 15 - \frac{35}{120} \cdot 6) r^2$$

$$+ (-\frac{1}{8} \cdot 8 + \frac{1}{2} \cdot 7 + \frac{7}{12} \cdot 6 - \frac{35}{120} \cdot 4 + \frac{21}{252} \cdot 2) r$$

$$+ (-\frac{1}{8} + \frac{1}{2} + \frac{7}{12} - \frac{35}{120} + \frac{21}{252})$$

$$= \sum_{i=1}^r i^7 + r^7 + 7r^6 + 21r^5 + 35r^4 + 35r^3 + 21r^2 + 7r + 1$$

$$= \sum_{i=1}^r i^7 + (r+1)^7 = \sum_{i=1}^{r+1} i^7$$

即  $n = r + 1$  時，本式亦成立

故 本式對所有  $n = 1, 2, 3, \dots$  均成立

$$(III) \sum_{i=1}^n i^k = \frac{1}{k+1} n^{k+1} + \frac{1}{2} n^k + \frac{\binom{k}{1}}{12} n^{k-2} - \frac{\binom{k}{3}}{120} n^{k-3} \\ + \frac{\binom{k}{5}}{252} n^{k-5} - \frac{\binom{k}{7}}{240} n^{k-7} + \frac{\binom{k}{9}}{132} n^{k-9} - \dots + \frac{\binom{k}{t_k}}{t_k} n$$

$k \in N = \{1, 2, 3, 4, \dots\}$

而其中  $1 = \frac{1}{k+1} + \frac{1}{2} + \frac{\binom{k}{1}}{12} - \frac{\binom{k}{3}}{120} + \frac{\binom{k}{5}}{252} - \frac{\binom{k}{7}}{240} \\ + \frac{\binom{k}{9}}{132} - \dots + \frac{\binom{k}{t_k}}{t_k}$

證明：當  $k = 1$  時  $\sum_{i=1}^n i = \frac{1}{2} n^2 + \frac{1}{2} n$  本式成立

當  $k = 2$  時  $\sum_{i=1}^n i^2 = \frac{1}{3} n^3 + \frac{1}{2} n^2 + \frac{2}{12} n$ , 本式

成立

令  $k = 1, 2, 3, \dots, P-1$  時 本式均成立

現在以與 I 及 II 相同的方法來證明  $k = P$  時，本式也成立

$$\text{即證 } \sum_{i=1}^n i^P = \frac{1}{P+1} n^{P+1} + \frac{1}{2} n^P + \frac{\binom{P}{1}}{12} n^{P-1} \\ - \frac{\binom{P}{3}}{120} n^{P-3} + \frac{\binom{P}{5}}{252} n^{P-5} - \frac{\binom{P}{7}}{240} n^{P-7} \\ + \frac{\binom{P}{9}}{132} n^{P-9} - \dots + \frac{\binom{P}{t_p}}{t_p} n$$

$$\text{當 } n = 1 \text{ 時, } i_1 = \frac{1}{P+1} + \frac{1}{2} + \frac{\binom{P}{1}}{12} - \frac{\binom{P}{3}}{120} + \frac{\binom{P}{5}}{252} - \frac{\binom{P}{7}}{240} + \frac{\binom{P}{9}}{132} - \dots + \frac{\binom{P}{P-1}}{t^P}, \text{ 本式成立}$$

令  $n = r$  時 本式成立

$$\begin{aligned} \text{即 } \sum_{i=1}^r i^P &= \frac{1}{P+1} r^{P+1} + \frac{1}{2} r^P + \frac{\binom{P}{1}}{12} r^{P-1} - \frac{\binom{P}{3}}{120} r^{P-3} \\ &\quad + \frac{\binom{P}{5}}{252} r^{P-5} - \frac{\binom{P}{7}}{240} r^{P-7} + \frac{\binom{P}{9}}{132} r^{P-9} - \dots + \frac{\binom{P}{P-1}}{t^P} r \end{aligned}$$

$$\begin{aligned} \text{則 } \frac{1}{P+1} (r+1)^{P+1} &+ \frac{1}{2} (r+1)^P + \frac{\binom{P}{1}}{12} (r+1)^{P-1} \\ &- \frac{\binom{P}{3}}{120} (r+1)^{P-3} + \frac{\binom{P}{5}}{252} (r+1)^{P-5} - \frac{\binom{P}{7}}{240} (r+1)^{P-7} \\ &+ \frac{\binom{P}{9}}{132} (r+1)^{P-9} - \dots + \frac{\binom{P}{P-1}}{t^P} (r+1) \\ &= \frac{1}{P+1} r^{P+1} + \frac{1}{2} r^P + \frac{\binom{P}{1}}{12} r^{P-1} - \frac{\binom{P}{3}}{120} r^{P-3} - \frac{\binom{P}{5}}{252} r^{P-5} \\ &- \frac{\binom{P}{7}}{240} r^{P-7} + \frac{\binom{P}{9}}{132} r^{P-9} - \dots \end{aligned}$$

$$\begin{aligned} &+ \frac{\binom{P}{P-1}}{t^P} r + \frac{\binom{P+1}{1}}{P+1} r^P + \left[ \frac{\binom{P+1}{2}}{P+1} + \frac{\binom{P}{1}}{2} \right] r^{P-1} \\ &+ \left[ \frac{\binom{P+1}{3}}{P+1} + \frac{\binom{P}{2}}{2} + \frac{\binom{P}{1} \binom{P-1}{12}}{12} \right] r^{P-2} \end{aligned}$$

$$\begin{aligned}
& + \left[ \frac{\binom{P+1}{4}}{P+1} - \frac{\binom{P}{5}}{2} - \frac{\binom{P}{1}\binom{P-1}{2}}{12} \right] r^{P-3} \\
& + \left[ \frac{\binom{P+1}{5}}{P+1} + \frac{\binom{P}{4}}{2} + \frac{\binom{P}{1}\binom{P-1}{3}}{12} - \frac{\binom{P}{3}\binom{P-3}{1}}{120} \right] r^{P-4} \\
& + \left[ \frac{\binom{P+1}{6}}{P+1} + \frac{\binom{P}{5}}{2} + \frac{\binom{P}{1}\binom{P-1}{4}}{12} - \frac{\binom{P}{3}\binom{P-3}{2}}{120} \right] r^{P-5} \\
& + \left[ \frac{\binom{P+1}{7}}{P+1} + \frac{\binom{P}{6}}{2} + \frac{\binom{P}{1}\binom{P-1}{5}}{12} \right. \\
& \quad \left. - \frac{\binom{P}{3}\binom{P-3}{3}}{120} + \frac{\binom{P}{5}\binom{P-5}{1}}{252} \right] r^{P-6} \\
& + \left[ \frac{\binom{P+1}{8}}{P+1} + \frac{\binom{P}{7}}{2} + \frac{\binom{P}{1}\binom{P-1}{6}}{12} \right. \\
& \quad \left. - \frac{\binom{P}{3}\binom{P-3}{4}}{120} + \frac{\binom{P}{5}\binom{P-1}{2}}{252} \right] r^{P-7} + \dots \\
& + \left[ \frac{1}{P+1} + \frac{1}{2} - \frac{\binom{P}{1}}{12} - \frac{\binom{P}{3}}{120} + \frac{\binom{P}{5}}{252} - \frac{\binom{P}{7}}{240} \right. \\
& \quad \left. + \frac{\binom{P}{9}}{132} - \frac{\binom{P}{P-1}}{t_p} \right] \\
= & \sum_{i=1}^r i^P + r^P + \binom{P}{1} r^{P-1} + \binom{P}{2} r^{P-2} + \binom{P}{3} r^{P-3} \\
& + \binom{P}{4} r^{P-4} + \binom{P}{5} r^{P-5} + \binom{P}{6} r^{P-6} \\
& + \binom{P}{7} r^{P-7} + \dots + 1
\end{aligned}$$

$$= \sum_{i=1}^r i^p + (r+1)^p = \sum_{i=1}^{r+1} i^p$$

即  $n = r + 1$  時，本式亦成立

故本式對所有  $n = 1, 2, 3, \dots$  均成立

所以本定理得以證明。

#### 四、最後附言：

(I) 目前的數學教科書，其形式都是「完成數學」由一連串的定理與證明或應用所組成，以致於有些學生誤認數學只不過是如此爾爾，其實這只是數學的一面，至於定理如何被人所發現，古人如何構想證明的方法等等則付之闕如。若能引入定理被發現及前人構想證明方法的經過過程，則不但能幫助學生多了解，更能引起學生學習數學的興趣與動機。

(II) 本作品將介紹由「歸納法」及「一般化」等發現定理的法則及過程，澈底說明發現定理的動機及數學研究中的觀察、實驗、歸納、證明等步驟，以供有志於數學研究的青年學生的一種優良參考。

(III) 本定理證明時，必須利用到下列的恆等式

$$\binom{P}{0} = \frac{\binom{P+1}{1}}{P+1} = 1$$

$$\binom{P}{1} = \frac{\binom{P+1}{2}}{P+1} + \frac{\binom{P}{1}}{2} = P$$

$$\binom{P}{2} = \frac{\binom{P+1}{3}}{P+1} + \frac{\binom{P}{2}}{2} + \frac{\binom{P}{1} \binom{P-1}{2}}{12}$$

$$\binom{P}{3} = \frac{\binom{P+1}{4}}{P+1} + \frac{\binom{P}{3}}{2} + \frac{\binom{P}{1} \binom{P-1}{2}}{12}$$

$$\binom{P}{4} = \frac{\binom{P+1}{5}}{P+1} + \frac{\binom{P}{4}}{2} + \frac{\binom{P}{1}\binom{P-1}{3}}{12} - \frac{\binom{P}{3}\binom{P-3}{1}}{120}$$

$$\binom{P}{5} = \frac{\binom{P+1}{6}}{P+1} + \frac{\binom{P}{5}}{2} + \frac{\binom{P}{1}\binom{P-1}{4}}{12} - \frac{\binom{P}{3}\binom{P-3}{2}}{120}$$

$$\binom{P}{6} = \frac{\binom{P+1}{7}}{P+1} + \frac{\binom{P}{6}}{2} + \frac{\binom{P}{1}\binom{P-1}{5}}{12} - \frac{\binom{P}{3}\binom{P-3}{3}}{120}$$

$$+ \frac{\binom{P}{5}\binom{P-5}{1}}{252}$$

$$\binom{P}{7} = \frac{\binom{P+1}{8}}{P+1} + \frac{\binom{P}{7}}{2} + \frac{\binom{P}{1}\binom{P-1}{6}}{12} - \frac{\binom{P}{3}\binom{P-3}{4}}{120}$$

$$+ \frac{\binom{P}{5}\binom{P-5}{2}}{252}$$

.....

$$\binom{P}{P} = \frac{\binom{P+1}{P+1}}{P+1} + \frac{\binom{P}{P}}{2} + \frac{\binom{P}{1}\binom{P-1}{P-1}}{12} - \frac{\binom{P}{3}\binom{P-3}{P-3}}{120}$$

$$+ \frac{\binom{P}{5}\binom{P-5}{P-5}}{252} - \frac{\binom{P}{7}\binom{P-7}{P-7}}{240} + \frac{\binom{P}{9}\binom{P-9}{P-9}}{132} - \dots$$

$$+ \frac{\binom{P}{P-1}\binom{1}{1}}{t_p}$$

$$= \frac{1}{P+1} + \frac{1}{2} + \frac{\binom{P}{1}}{12} - \frac{\binom{P}{3}}{120} + \frac{\binom{P}{5}}{252} - \frac{\binom{P}{7}}{240}$$

$$+ \frac{\binom{P}{9}}{132} - \dots + \frac{\binom{P}{P-1}}{t_p} = 1$$

上面所列出的各式，其證明均很容易，但其一般式的證明則比較困難，請讀者來尋求下列一般式的證明方法

$$\binom{P}{r} = \frac{\binom{P+1}{r+1}}{P+1} + \frac{\binom{P}{0}\binom{P}{r}}{2} + \frac{\binom{P}{1}\binom{P-1}{r-1}}{12} + \frac{\binom{P}{3}\binom{P-3}{r-3}}{120}$$

$$+ \frac{\binom{P}{5}\binom{P-5}{r-5}}{252} - \frac{\binom{P}{7}\binom{P-7}{r-7}}{240} + \frac{\binom{P}{9}\binom{P-9}{r-9}}{132} - \dots$$

$$+ \frac{\binom{P}{r-1}\binom{P-r+1}{r-r+1}}{t_r}$$

$$\text{而其中 } 1 = \frac{1}{r+1} + \frac{1}{2} + \frac{\binom{r}{1}}{12} - \frac{\binom{r}{3}}{120} + \frac{\binom{r}{5}}{252} - \frac{\binom{r}{7}}{240} + \frac{\binom{r}{9}}{132} - \dots$$

$$+ \frac{\binom{r}{r-1}}{t_r}$$

且  $P=1, 2, 3, 4, \dots$  及  $0 \leq r \leq P$

$$\text{即 } \binom{P}{r} = \frac{\binom{P+1}{r+1}}{P+1} + \sum_{i=1}^r \frac{\binom{P}{j-1}\binom{P-j+1}{r-j+1}}{t_j},$$

$P=1, 2, 3, 4, \dots$  及  $0 \leq r \leq P$

$$\text{其中 } 1 = \frac{1}{P+1} + \sum_{j=1}^r \frac{\binom{r}{j-1}}{t_j}$$
